

# ALGEBRA-BASED PHYSICS-1: MECHANICS (PHYS135A-01): WEEK 1

---

Jordan Hanson

September 6th - September 8th, 2017

Whittier College Department of Physics and Astronomy

1. Professor Jordan Hanson
2. Contact: [jhanson2@whittier.edu](mailto:jhanson2@whittier.edu), SLC 212
3. Syllabus: Moodle
4. Office hours: Tuesdays 12:50, Wednesdays 15:00
5. Text: College Physics ([openstax.org](https://openstax.org))
6. Homework: Assigned from the book Mondays, due the following Monday
7. Lab notebooks (will distribute shortly)

## OPENING REMARKS - WELCOME!

---

## COURSE INTRODUCTION

---

- What do you hope to learn from this course?
- What do you hope to do with this new knowledge?
- What do you expect the lectures to do for you?
- What do you expect the book to do for you?
- How many hours per week do you expect to spend on this course in order to have success?

# FORCE AND MOTION AND CONCEPTUAL EVALUATION (FMCE)

---

*Physics - φυσική - "phusiké": knowledge of nature*  
*from φύσις - "phúsis": nature*

## 1. Methods of approximation

- Estimating the correct order of magnitude
- Function approximation
- Unit analysis

## 2. Coordinates and vectors

- Scalars and vectors
- Cartesian (rectangular) coordinates, displacement
- Vector addition, subtraction, and multiplication

## 3. Review of geometry and trigonometry techniques

- Similar triangles
- Pythagorean theorem
- Sine, cosine, tangent ...

## HOMEWORK PROBLEMS (DUE WEDNESDAY, SEPTEMBER 13)

- Chapter 1, exercise 1
- Chapter 1, exercise 9
- Chapter 1, exercise 10
- Chapter 1, exercise 29
- Chapter 1, exercise 35

## METHODS OF APPROXIMATION

---

# METHODS OF APPROXIMATION - ESTIMATION (CHAPTER 1)

In science and engineering, **estimation** is to obtain a quantity in the absence of precision, informed by rational constraints.

1. Define relevant **scales**

- 1 *AU* for the solar system (distance from Sun to Earth)
- 1 *angstrom* ( $10^{-10}$  meters) for cell membranes

2. Obtain **complex quantities** from simple ones

- Obtain *areas* and *volumes* from *lengths*
- Obtain *rates* from *numerators* and *denominators*

3. Constrain the unknown with **upper** and **lower** limits

- The solar system is *less than one light-year* across
- An insect is *at least one millimeter* long

## METHODS OF APPROXIMATION - ESTIMATION (CHAPTER 1)

Estimate the mass of ants in an ant colony. Assume that the colony is a species known to have  $10^5$  ants (roughly) per colony.

- A: 0.01 kg
- B: 0.1 kg
- C: 1 kg
- D: 10 kg

An adult blue whale is about 30 meters long. What is the mass of a blue whale calf? (1 tonne = 1000 kg).

- A: 100 kg
- B: 0.5 tonnes
- C: 5 tonnes
- D: 20 tonnes

# METHODS OF APPROXIMATION - ESTIMATION (CHAPTER 1)

Table 1.3 Approximate Values of Length, Mass, and Time

Lengths in meters		Masses in kilograms (more precise values in parentheses)	Times in seconds (more precise values in parentheses)
$10^{-18}$	Present experimental limit to smallest observable detail	$10^{-30}$ Mass of an electron ( $9.11 \times 10^{-31}$ kg)	$10^{-23}$ Time for light to cross a proton
$10^{-15}$	Diameter of a proton	$10^{-27}$ Mass of a hydrogen atom ( $1.67 \times 10^{-27}$ kg)	$10^{-22}$ Mean life of an extremely unstable nucleus
$10^{-14}$	Diameter of a uranium nucleus	$10^{-15}$ Mass of a bacterium	$10^{-15}$ Time for one oscillation of visible light
$10^{-10}$	Diameter of a hydrogen atom	$10^{-5}$ Mass of a mosquito	$10^{-13}$ Time for one vibration of an atom in a solid
$10^{-8}$	Thickness of membranes in cells of living organisms	$10^{-2}$ Mass of a hummingbird	$10^{-8}$ Time for one oscillation of an FM radio wave
$10^{-6}$	Wavelength of visible light	1 Mass of a liter of water (about a quart)	$10^{-3}$ Duration of a nerve impulse
$10^{-3}$	Size of a grain of sand	$10^2$ Mass of a person	1 Time for one heartbeat
1	Height of a 4-year-old child	$10^3$ Mass of a car	$10^5$ One day ( $8.64 \times 10^4$ s)
$10^2$	Length of a football field	$10^8$ Mass of a large ship	$10^7$ One year (y) ( $3.16 \times 10^7$ s)
$10^4$	Greatest ocean depth	$10^{12}$ Mass of a large iceberg	$10^9$ About half the life expectancy of a human
$10^7$	Diameter of the Earth	$10^{15}$ Mass of the nucleus of a comet	$10^{11}$ Recorded history
$10^{11}$	Distance from the Earth to the Sun	$10^{23}$ Mass of the Moon ( $7.35 \times 10^{22}$ kg)	$10^{17}$ Age of the Earth
$10^{16}$	Distance traveled by light in 1 year (a light year)	$10^{25}$ Mass of the Earth ( $5.97 \times 10^{24}$ kg)	$10^{18}$ Age of the universe
$10^{21}$	Diameter of the Milky Way galaxy	$10^{30}$ Mass of the Sun ( $1.99 \times 10^{30}$ kg)	
$10^{22}$	Distance from the Earth to the nearest large galaxy (Andromeda)	$10^{42}$ Mass of the Milky Way galaxy (current upper limit)	
$10^{26}$	Distance from the Earth to the edges of the known universe	$10^{53}$ Mass of the known universe (current upper limit)	

Figure 1: Table 1.3 from the text.

## METHODS OF APPROXIMATION - ESTIMATION (CHAPTER 1)

How long does it take an airliner to fly across the Atlantic ocean? Assume the velocity is 500 mph, and the radius of the Earth is 7000 km.

- A: 10 hours
- B: 15 hours
- C: 2 hours
- D: 4 hours

A flock of birds takes one minute to pass overhead, and it is about 100 meters wide, with most birds flying at roughly the same altitude. How many birds are in the flock?

- A: 100 birds
- B: 1,000 birds
- C: 10,000 birds
- D: 100,000 birds

In science and engineering, **function approximation** or **expanding a function** is a technique in which a simple function is used obtain the value of a more complicated function near a point where they are approximately equal.

## 1. Memorizing **special cases**

- $\sin(x) \approx x$ , when  $|x| < 1$
- $\tan(x) \approx x$ , when  $|x| < 1$
- $(1+x)^{1/2} \approx 1 + \frac{1}{2}x$ , when  $|x| < 1$
- $\exp(x) \approx 1 + x$ , when  $|x| < 1$

## 2. Utilizing the **Taylor Series** (encounter in calculus...)

- $f(x) \approx f(a) + \frac{f'(a)}{1!}(x-a) + \frac{f''(a)}{2!}(x-a)^2 + \frac{f'''(a)}{3!}(x-a)^3 + \dots$

**Figure 2:** Certain functions may be approximated by simpler ones. In this case,  $\sin(x)$  is approximated by  $x$  near  $x = 0$ , and  $(1+x)^{1/2}$  is approximated by  $1 + \frac{1}{2}x$  near  $x = 0$ .

The height in meters of a surfer above some average height as he bobs in the waves is described by  $h(t) = \sin(t)$ . What is his height at 1.0 second? What is his height at -1.0 second?

- A: 1 meter, -1 meter
- B:  $\pi$  meters,  $-\pi$  meters
- C: -1 meter, 1 meter
- D:  $-\pi$  meters,  $\pi$  meters

The value of an investment in dollars,  $v$ , versus time in years,  $t$ , follows the form  $v(t) = P \exp(rt)$ , where  $P$  is the value at  $t = 0$ , and  $r = 1/3$ . What is  $v(1)$ , the value after one year?

- A:  $\approx 1/3P$
- B:  $\approx 2/3P$
- C:  $\approx 3/2P$
- D:  $\approx 4/3P$

# METHODS OF APPROXIMATION - UNITS (CHAPTERS 1)

Physics requires **units** to relate ideas to the real world, and **unit analysis** is a powerful tool to eliminate incorrect results and to facilitate estimation.

## 1. SI units, and kilogram-meter-second unit set

- mass: **kilogram** (gram =  $10^{-3}$  kg, milligram =  $10^{-6}$  kg)
- length: **meter** (millimeter =  $10^{-3}$  m, kilometer =  $10^3$  m)
- time: **second** (1 year  $\approx \pi \times 10^7$  sec, 1 hour = 3600 sec)

## 2. Unit analysis

- If we are calculating a density, the units should work out to be  $\text{kg}/\text{m}^3$
- Identifying the fundamental unit in a complex calculation often simplifies it (when done properly, this reveals the beauty of physics)

## METHODS OF APPROXIMATION - UNITS (CHAPTERS 1)

A millenium is 1000 years. If a glacier retreats at a pace of 10 cm per year, what is this rate in meters per millenium?

- A: 0.1 meter per millenium
- B: 1 meter per millenium
- C: 10 meters per millenium
- D: 100 meters per millenium

Ice has a density of 0.917 grams per centimeter cubed. What is this density in kilograms per meter cubed?

- A: 91.7 kg/m<sup>3</sup>
- B: 917 kg/m<sup>3</sup>
- C: 9170 kg/m<sup>3</sup>
- D: 9.17 kg/m<sup>3</sup>

Sometimes, the beauty of physics arises from choosing the right unit.

[http : //joshworth.com/dev/pixelspace/pixelspace\\_solarsystem.html](http://joshworth.com/dev/pixelspace/pixelspace_solarsystem.html)

The Sun in this ruler is at 0 km, and Jupiter is at about 780,000,000 km (good luck finding it). Clearly, the kilometer is the wrong unit to choose for interplanetary distances. What if we defined a new unit, the **astronomical unit**, as the distance between the Earth and the Sun?

## METHODS OF APPROXIMATION - UNITS (CHAPTERS 1)

Planetary orbital radii in AU (geometric means):

Mercury	0.379
Venus	0.722
Earth	1.00
Mars	1.52
Jupiter	5.20
Saturn	9.54
Uranus	19.2
Neptune	30.1

**Figure 3:** Why such simple numbers? There is a set of simple relationships between the *orbital period* and the *orbital radius* of planets called Kepler's Laws, which led to the discovery of **Newton's Law of Gravity**.

# COORDINATES AND VECTORS

---

Physics requires **mathematical objects** to build equations that capture the behavior of nature. Two examples of such objects are **scalar** and **vector** quantities. Each type of object obeys similar but different rules.

## 1. Scalar quantities

- mass:  $m_1 + (m_2 + m_3) = (m_1 + m_2) + m_3$
- speed:  $v_1(v_2 + v_3) = v_1v_2 + v_1v_3$
- charge:  $q_1\left(\frac{1}{q_1}\right) = 1, q_1(0) = 0$

## 2. Vector quantities

- velocity:  $\vec{v}_1 + (\vec{v}_2 + \vec{v}_3) = (\vec{v}_1 + \vec{v}_2) + \vec{v}_3$
- tension:  $\vec{t}_1 \cdot (\vec{t}_2 + \vec{t}_3) = \vec{t}_1 \cdot \vec{t}_2 + \vec{t}_1 \cdot \vec{t}_3$

## COORDINATES AND VECTORS - SCALARS, VECTORS (CHAPTERS 2.1-2.2)

A vector may be expressed as *a list of scalars*:  $\vec{v} = (4, 2)$  (a vector with two *components*),  $\vec{u} = (3, 4, 5)$  (three *components*). Now, we know how to add and subtract scalars. How do we add and subtract vectors?

What is

$(1, 3, 8) +$

$(0, 2, 1)$ ?

Answer:  $(1, 5, 9)$

In other words, when adding vectors, we add them component by component.

How do we subtract vectors? In the same fashion:

What is

$(1, 3, 8) -$

$(0, 2, 1)$ ?

Answer:  $(1, 1, 7)$

In other words, when subtracting vectors, we subtract them component by component.

How do we multiply vectors? In the same fashion, *for one kind of multiplication*:

What is

$$(1, 3, 8) \cdot (0, 2, 1)?$$

$$\text{Answer: } 1 \cdot 0 + 3 \cdot 2 + 8 \cdot 1 = 14$$

*This kind of multiplication is known as the dot-product.* There is also the *cross-product*, which we will save for later.

## COORDINATES AND VECTORS - COORDINATES (CHAPTERS 2.1-2.2)

The components of a vector may describe quantities in a **coordinate system**, such as *Cartesian coordinates* - after René Descartes.

Vectors in the 3D Cartesian coordinate system (x,y,z) may be written in the following notation:

$$\vec{v} = a\hat{i} + b\hat{j} + c\hat{k}$$

- a: The amount in the +x-direction,  $\hat{i}$ : a vector of length 1, in the +x-direction
- b: The amount in the +y-direction,  $\hat{j}$ : a vector of length 1, in the +y-direction
- c: The amount in the +z-direction,  $\hat{k}$ : a vector of length 1, in the +z-direction

## COORDINATES AND VECTORS - VECTORS (CHAPTERS 2.1-2.2)

**Figure 4:** (a) Two vectors in a two-dimensional Cartesian coordinate system:  $\vec{u} = 0.5\hat{i} + 1.0\hat{j}$  and  $\vec{v} = 2.0\hat{i} + 1.0\hat{j}$ . (b) What is  $\vec{u} + \vec{v}$ ? Adding components:  $\vec{u} + \vec{v} = 2.5\hat{i} + 2.0\hat{j}$ .

## COORDINATES AND VECTORS - VECTORS (CHAPTERS 2.1-2.2)

**Figure 5:** (a) Two vectors in a two-dimensional Cartesian coordinate system:  $\vec{u} = 0.5\hat{i} + 1.0\hat{j}$  and  $\vec{v} = 2.0\hat{i} + 1.0\hat{j}$ . (b) What is  $\vec{u} - \vec{v}$ ? Subtracting components:  $\vec{u} - \vec{v} = 1.5\hat{i} + 0.0\hat{j}$ .

## COORDINATES AND VECTORS - VECTORS (CHAPTERS 2.1-2.2)

**Figure 6:** (a) Two vectors in a two-dimensional Cartesian coordinate system:  $\vec{u} = 0.5\hat{i} + 1.0\hat{j}$  and  $\vec{v} = 2.0\hat{i} + 1.0\hat{j}$ . (b) To compute  $\vec{w} - \vec{v}$ , arrange the vectors to get a sense of the result,  $\vec{u}$ .

## COORDINATES AND VECTORS - VECTORS (CHAPTERS 2.1-2.2)

$$\vec{p} = 4\hat{i} + 2\hat{j}, \vec{q} = -4\hat{i} + 2\hat{j}.$$

Compute  $\vec{p} \cdot \vec{q}$ .

- A: 12
- B: -12
- C: 4
- D: 8

$$\vec{p} = -1\hat{i} + 6\hat{j}, \vec{q} = 3\hat{i} + 0.5\hat{j}.$$

Compute  $\vec{p} \cdot \vec{q}$ .

- A: -1
- B: 1
- C: 0
- D: 3

## COORDINATES AND VECTORS - VECTORS (CHAPTERS 2.1-2.2)

Why was the last answer zero? Look at it graphically:

Figure 7: Two vectors  $\vec{p}$  and  $\vec{q}$  are *orthogonal* if  $\vec{p} \cdot \vec{q} = 0$ .

## COORDINATES AND VECTORS - VECTORS (CHAPTERS 2.1-2.2)

What if the vectors are parallel? Look at it graphically:

Figure 8: Two vectors  $\vec{p}$  and  $\vec{q}$  are *parallel* if  $\vec{p} \cdot \vec{q}$  is maximal.

## COORDINATES AND VECTORS - DOT PRODUCT (CHAPTERS 2.1-2.2)

The *length* or *norm* of a vector  $\vec{v} = a\hat{i} + b\hat{j}$  is  $|\vec{v}| = \sqrt{a^2 + b^2}$ .

Figure 9: Computing the norm of a vector  $\vec{p}$ .

## COORDINATES AND VECTORS - DOT PRODUCT (CHAPTERS 2.1-2.2)

Notice that  $\sqrt{\vec{p} \cdot \vec{p}} = |\vec{p}|$ .

Let  $\theta_p$  be the angle between  $\vec{p}$  and the x-axis.

$$p_x = \vec{p} \cdot \hat{i} = |\vec{p}| \cos(\theta_p).$$

$$p_y = \vec{p} \cdot \hat{j} = |\vec{p}| \sin(\theta_p).$$

*Theorem:* The dot product of two vectors  $\vec{p}$  and  $\vec{q}$  is  $|\vec{p}||\vec{q}| \cos(\theta)$ , if  $\theta$  is the angle between them.

*Proof:*

$$\begin{aligned}\vec{p} \cdot \vec{q} &= p_x q_x + p_y q_y = |p||q| \cos \theta_p \cos \theta_q + |p||q| \sin \theta_p \sin \theta_q \\ &= |p||q|(\cos \theta_p \cos \theta_q + \sin \theta_p \sin \theta_q) = |p||q| \cos(\theta_p - \theta_q) \\ &= |p||q| \cos \theta.\end{aligned}$$

$$\vec{p} \cdot \vec{q} = |p||q| \cos \theta$$

## COORDINATES AND VECTORS - DOT PRODUCT (CHAPTERS 2.1-2.2)

An object moves at 2 m/s at  $\theta = 60^\circ$  with respect to the x-axis. What is the velocity of the object?

- A:  $(1\hat{i} + 1\hat{j})$  m/s
- B:  $(\sqrt{3}\hat{i} + 1\hat{j})$  m/s
- C:  $(\sqrt{3}\hat{i} + \sqrt{3}\hat{j})$  m/s
- D:  $(1\hat{i} + \sqrt{3}\hat{j})$  m/s

What is the dot product of this velocity with another velocity: 5 m/s along the x-axis?

- A:  $1 \text{ (m/s)}^2$
- B:  $5 \text{ (m/s)}^2$
- C:  $10 \text{ (m/s)}^2$
- D:  $5 \text{ (m/s)}$

## COORDINATES AND VECTORS - SCALARS, VECTORS (CHAPTERS 2.1-2.2)

Is it possible to multiply vectors and scalars? Of course:

$$a_1\vec{p} = a_1p_x\hat{i} + a_1p_y\hat{j}.$$

Also, multiplication properties still hold. For example:

$$(a_1 + a_2)\vec{p} = a_1\vec{p} + a_2\vec{p}.$$

A spacecraft moves at 400 m/s, at an angle of 30 degrees with respect to the x-axis. If it fires two thrusters that boost the x-component and y-component of the velocity by 25% and 50%, respectively, what is the final velocity?

- A:  $(433\hat{i} + 300\hat{j})$  m/s
- B:  $(300\hat{i} + 433\hat{j})$  m/s
- C: 400 m/s
- D:  $(400\hat{i} + 433\hat{j})$  m/s

We define the *position* of an object as a vector locating it in a given coordinate system. The scalar *distance* is the norm of the position vector, that is, the distance to to the origin.

Now we can introduce the concept of **displacement**: a vector describing a movement of an object.

## COORDINATES AND VECTORS - DISPLACEMENT (CHAPTERS 2.1-2.2)

**Figure 10:** Suppose an object moves from position  $\vec{v}$  to  $\vec{w}$ . In this case, the displacement is  $\vec{u}$ . Thus, the final position is the initial position, plus the displacement.

It follows that the *displacement* is zero if the initial and final positions are the same, but the *distance travelled* is not.

Suppose a jet fighter travelling at 800 km per hour banks such that it flies in a circle of radius 0.5 km. How long does it take to complete the circle? What is the distance traveled, and what is the displacement?

- A:  $2\pi$  km, 28 seconds,  $2\pi$  km
- B:  $\pi$  km, 14 seconds,  $\pi$  km
- C:  $\pi$  km, 28 seconds,  $\pi$  km
- D:  $\pi$  km, 14 seconds, 0 km

Jet fighters in the film Top Gun (1986):

[https://www.youtube.com/watch?v=WhYZc08Jk\\_Y](https://www.youtube.com/watch?v=WhYZc08Jk_Y)

Download the Java applet (you may need to update Java):  
[https://phet.colorado.edu/en/simulation/  
vector-addition](https://phet.colorado.edu/en/simulation/vector-addition)

## COORDINATES AND VECTORS - SIMULATION ACTIVITY

Let the y-axis represent altitude, and the x-axis represent horizontal distance. Let the distance unit at the top right (for  $R_x$  and  $R_y$ ) be 100 m. That is, 5 corresponds to 500 m.

- Using the vector tool, create a displacement vector for Jester's jet fighter.
  1. Jester begins the dive at 3 km altitude and ends at 1 km.
  2. He begins at a horizontal distance of 0 km, and the angle of his dive is -45 degrees.
- Using the vector tool, create a displacement vector for Maverick's jet fighter.
  1. Maverick begins the dive at 2.5 km and ends at 1 km.
  2. He begins at a horizontal distance of 0 km, and the angle of his dive is -45 degrees.

## COORDINATES AND VECTORS - SIMULATION ACTIVITY

Let the y-axis represent altitude, and the x-axis represent horizontal distance. Let the distance unit at the top right (for  $R_x$  and  $R_y$ ) be 100 m. That is, 5 corresponds to 500 m.

- What is the initial displacement vector between Maverick and Jester? (Take Jester's initial position and subtract Maverick's initial position).
- What are the final positions of Jester and Maverick? Specify both the x and y coordinates.
- What distance does each jet fighter travel?
- Suppose the speed of each aircraft is 0.1 km/s. How long does the dive take?
- Given that you know how long the dive takes, what is the velocity vector of the aircraft? (It's the same for both fighters).

## COORDINATES AND VECTORS - AVERAGE VELOCITY (CHAPTER 2.3)

Average velocity is the ratio of the displacement to the elapsed time.

$$\boxed{\vec{v}_{\text{avg}} = \frac{\Delta \vec{x}}{\Delta t}} \quad (1)$$

The *average speed* is the norm of the average velocity:

$$\boxed{v_{\text{avg}} = \frac{|\Delta \vec{x}|}{\Delta t}} \quad (2)$$

If the motion is in one dimension, then the average speed is

$$v_{\text{avg}} = \frac{x_f - x_i}{t_f - t_i} \quad (3)$$

**Figure 11:** A Formula-1 driver keeps his car on the track by following a path approximated by the position vectors  $u$ ,  $v$ ,  $u$ , and  $v$ . The dashed arrow represents the total displacement.

If  $\vec{u} = (20\hat{i} + 30\hat{j})$  m, and  $\vec{v} = (30\hat{i} + 20\hat{j})$  m, what is the total displacement? If the elapsed time is 10 seconds, what is the average velocity?

- A:  $(50\hat{i} + 50\hat{j})$  m, 14 m/s
- B:  $(80\hat{i} + 100\hat{j})$  m, 10 m/s
- C:  $(100\hat{i} + 100\hat{j})$  m, 14 m/s
- D:  $(50\hat{i} + 150\hat{j})$  m, 10 m/s

# REVIEW OF GEOMETRY AND TRIGONOMETRY TECHNIQUES

---

Figure 12: Angles of a triangle add up to  $\pi$  ( $180^\circ$ ).

$$\angle OCD = \pi/2 = \angle OCE + \angle DCE = \angle OCE + \alpha \quad (4)$$

$$\angle OCE + \angle COE + \pi/2 = \pi = \angle OCE + \theta + \pi/2 \quad (5)$$

$$\angle OCE + \theta = \pi/2 \quad (6)$$

$$\theta = \alpha \quad (7)$$

## REVIEW OF GEOMETRY AND TRIGONOMETRY TECHNIQUES

Figure 13: Proof of Pythagorean theorem.

$$A_1 = (a + b)^2 = a^2 + b^2 + 4((1/2)ab) \quad (8)$$

$$A_2 = c^2 + 4((1/2)ab) = A_1 \quad (9)$$

$$a^2 + b^2 = c^2 \quad (10)$$

One soccer teammate passes the ball to another. The player without the ball is 7 meters away from the player with the ball, and they are both running in the same direction. The player without the ball runs ahead by 24 meters before the pass. How far does the ball travel?

- A: 7 meters
- B: 24 meters
- C: 25 meters
- D: 17 meters

# REVIEW OF GEOMETRY AND TRIGONOMETRY TECHNIQUES

Figure 14: Memorize the properties of these special triangles.

**Figure 15:** Working definitions of trigonometric functions.

What is  $\sin(30^\circ)$ ?

- A:  $1/2$
- B:  $\sqrt{3}/2$
- C: 0
- D: 1

What is  $\tan(45^\circ)$ ?

- A:  $1/2$
- B:  $\sqrt{3}/2$
- C: 0
- D: 1

What is  $\sin(30^\circ)^2 + \cos(30^\circ)^2$ ?

- A:  $1/2$
- B:  $\sqrt{3}/2$
- C:  $0$
- D:  $1$

A right-triangle has sides of length 3, 4, and a hypoteneuse of 5. What are the angles inside the triangle?

- A:  $\arctan(5/4)$ ,  $\arctan(4/5)$ ,  $\pi/2$
- B:  $\arctan(1)$ ,  $\arctan(4/5)$ ,  $\pi/2$
- C:  $\arctan(4/3)$ ,  $\arctan(3/4)$ ,  $\pi/2$
- D:  $\arctan(3/4)$ ,  $\arctan(3/4)$ ,  $\pi/2$

## CONCLUSION

---

## Chapters 1, 2.

### 1. Methods of approximation

- Estimating the correct order of magnitude
- Function approximation
- Unit analysis

### 2. Coordinates and vectors

- Scalars and vectors
- Cartesian (rectangular) coordinates, displacement
- Vector addition, subtraction, and multiplication

### 3. Review of geometry and trigonometry techniques

- Parallel lines, similar triangles
- Pythagorean theorem
- Sine, cosine, tangent ...

## ANSWERS

---

## ANSWERS

- Mass of ants: 0.1 kg
- Mass of baby whale: 5 tonnes
- Length of flight is 10 hours
- Number of birds is 10,000
- Height of surfer is 1.0 meter, -1.0 meter
- Value of investment is  $\frac{4}{3}P$
- The glacier is retreating at 100 meters per millenium
- Ice has a density of 917 kg/m<sup>3</sup>
- -12
- 0
- $(\hat{i} + \sqrt{3}\hat{j})$  m/s
