

# midterm

$$1) a) E = \frac{1}{4\pi\epsilon_0} \frac{q_1}{r^2} \quad @ \quad r = 1 \text{ mm}$$
$$E = 2 \times 10^{-3}$$

$$2 \times 10^{-3} = \frac{1}{4\pi\epsilon_0} = \frac{q}{(1 \times 10^{-3})^2}$$

$$r = 5 \text{ mm} \rightarrow E = \frac{1}{4\pi\epsilon_0} \frac{q}{(5 \times 10^{-3})^2}$$

$$E = 2 \times 10^{-3} \times 10^{-6} \cdot \frac{1}{25 \times 10^{-6}} \rightarrow \boxed{8 \times 10^{-5} \frac{\text{V}}{\text{C}}}$$

$$b) 8 \times 10^{-3} = \frac{1}{4\pi\epsilon_0} \frac{1 \times 10^{-6}}{r^2}$$

$$3 \mu\text{C} \rightarrow E = \frac{1}{4\pi\epsilon_0} \frac{3 \times 10^{-6}}{r^2}$$

$$= 8 \times 10^3 \times 3 \times 10^{-6} = \boxed{24 \times 10^{-3} \frac{\mu}{\text{C}}}$$

$$2) m = 4 \times 10^{-16} \text{ kg}, E = 6131.25 \text{ N/C}$$

$$a) \text{ one electron} = 9.1 \times 10^{-31} \text{ kg}$$

$$\text{total \# of electrons} = \frac{4 \times 10^{-16}}{9.1 \times 10^{-31}} = \boxed{4.39 \times 10^{14}}$$

$$b) q = 4.39 \times 10^{14} \times 1.6 \times 10^{-19} = 7.03 \times 10^{-5} \text{ C}$$

$$qE = ma = \frac{7.03 \times 10^{-5} \times 6131.25}{4 \times 10^{-16}} = \boxed{1.078 \times 10^{15} \text{ m/sec}^2}$$

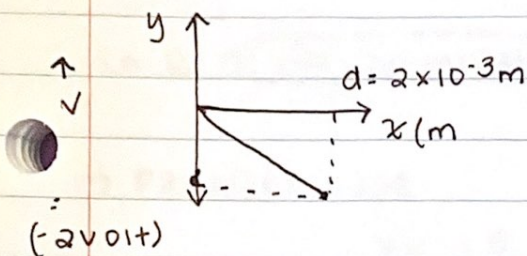

1) a)  $K \cdot E = qV$

$$KE_{Hyd} = 1.6 \times 10^{-19} \times 4 \times 10^3 = 6.4 \times 10^{-16} \text{ J}$$

$$KE_{He} = 2 \times 1.6 \times 10^{-19} \times 4 \times 10^3 = 12.8 \times 10^{-16} \text{ J}$$

b)  $E = \frac{\Delta V}{\Delta x} = \frac{4 \times 10^3}{5 \times 10^{-2}} = \boxed{8 \times 10^4 \text{ V/m}}$

2)  $E = 1 \text{ kV/m}$  or  $1000 \text{ V/m}$

the slope is  $= m = -1000 \text{ V/m}$

the y-int of the fcn is 0  
as the graph initiates at  
the origin.

3) a)  $C = \frac{\epsilon_0 A}{d} = \frac{8.85 \times 10^{-12} \times 10^{-4}}{2 \times 10^{-3}} = \boxed{4.425 \times 10^{-13} \text{ F}}$

b)  $E = \frac{1}{2} CV^2 = \frac{1}{2} \times 4.425 \times 10^{-13} \times 25 = \boxed{55.31 \times 10^{-13} \text{ J}}$

4) To get more capacitance, we should connect the identical capacitors in parallel. The total capacitance will increase.

$$I = ? \quad R = 50\Omega$$

1) a)  $r_1 = 2\Omega$

$$E_1 = 1.5V$$

$$r_2 = 2\Omega$$

$$E_2 = 1.5V$$

$$\rightarrow -E_2 + I r_2 + I r_1 - E_1 + I R = 0$$

$$= -1.5 + I(r_1 + r_2 + R) - 1.5V = 0$$

$$I = \frac{3V}{r_1 + r_2 + R} = \frac{3}{2 + 2 + 50} = \boxed{55.56 \text{ mA}}$$

b)  $P_{\text{total}} = P_{r_1} + P_{r_2} + P_R$

$$= (55.56 \text{ mA})^2 \times 2 + (55.56 \text{ mA})^2 \times 2 + (55.56 \text{ mA})^2 \times 50$$

$$= \boxed{777.51 \text{ mWatts}}$$

in R  $\rightarrow \boxed{154.34 \text{ mWatts}}$

$\rightarrow$  Parallel case:

$$\frac{V_x - 1.5}{2} + \frac{V_x - 1.5}{2} + \frac{V_x}{50} = 0$$

$$25V_x - 37.5 + 25V_x - 37.5 + V_x = 0$$

$$= \boxed{1.47 \text{ V}}$$

$$I_1 = \frac{1.5 - 1.47}{2} = 15 \text{ mAmp}$$

$$I_2 = \frac{1.5 - 1.47}{2} = 15 \text{ mAmp}$$

$$\left. \begin{array}{l} I_1 \\ I_2 \end{array} \right\} \underline{30 \text{ mAmp}}$$

Total PC:  $P_{r_1} + P_{r_2} + P_R$

$$= (15 \text{ m})^2 \times 2 + (15 \text{ m})^2 \times 2 + (30 \text{ m})^2 \times 50$$

$$= \boxed{45.9 \text{ mW}}$$

R  $\rightarrow \boxed{45 \text{ mW}}$

b)  $40 - (-75) = 40 + 75 = 115 \text{ mV}$
