A sprinter has a constant acceleration of 5.0 m/s². Suppose she starts from rest. (a) How long does it take her to reach her top speed of 10.0 m/s? (b) What is her displacement at that time? (c) Suppose she is running the 100 meter sprint. If she continues at 10.0 m/s for the remainder of the race, what will be her total time?

(a)
$$\alpha = 5.0 \text{ m/s}^2$$

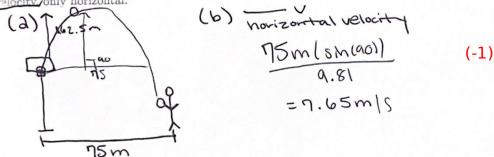

top Speed = 10m(s

$$\begin{aligned}
t &= \frac{10m\text{Is}^2}{5.0 \text{ m/s}^2} = 2s
\end{aligned}$$
(b) $\Delta x = \overline{X} = \overline{X}$;

$$\Delta x = 10 - 5 = 5$$
(c) 100 m $\alpha = 5 \text{ m/s}^2$

$$V = 10 + 2(5)(100)
\end{aligned}$$
Motion in Two and Three Dimensions
$$V = 100 \times 5 \times 100$$

Consider pull a third child on a snow saucer sled exerting forces \bar{F}_1 and \bar{F}_2 as shown from above in Fig. 1. Find the acceleration of the system if the mass of the child and sled together is 49.0 kg. Note that the direction of the frictional force is unspecified; it will be in the opposite direction of the sum of \bar{F}_1 and \bar{F}_2 .

ctional force is unspecified; it will be in the opposite direction of the sum of
$$F_1$$
 and F_2 .

A) $Q = \frac{14.3N-9.5N}{49 \text{ kg}}$

$$Q = \frac{14.3N-9.5N}{49 \text{ kg}}$$

Nicely done!
